1 Data Description

The following figures further illustrate distributions of our key variables. Figures A1 to A8 summarize the most important aspects of our data. All histograms are relative to province-years as unit of analysis.

- Figure A1 shows the number of CDM projects, 2004-2009.
- Figure A2 shows the number of renewable CDM projects, 2004-2009.
- Figure A3 shows the number of non-renewable CDM projects, 2004-2009.
- Figure A4 shows the distribution of electricity consumption in trillion kilowatt hours.
- Figure A5 shows the distribution of real per capita GDP in thousand US\$ in constant 2005 prices.
- Figure A6 shows distribution of foreign direct investments (FDIs) in billion US\$.
- Figure A7 shows population size in millions.
- Figure A8 shows the distribution of the economic growth variable.
- Figure A9 shows the distribution of the primary sector variable.

Figure A1: Histogram of the number of CDM projects.

Figure A2: Histogram of the number of renewable CDM projects.

Distribution of Non-Renewable CDM Projects (Count)

Figure A3: Histogram of the number of non-renewable CDM projects.

Distribution of Electricity Consumption

Figure A4: Histogram of electricity consumption.

Figure A5: Histogram of real per capita GDP.

Figure A6: Histogram of foreign direct investments.

Figure A7: Histogram of population.

Figure A8: Histogram of economic growth variable.

Distribution of Primary Sector Variable

Figure A9: Histogram of primary sector variable.

Table A2: Regression results for a zero inflated negative binomial model.

4 Robustness

Robustness: Political Control Model

Table A3 adds political control variables to our regressions. These variables are coded in the following fashion from a database compiled by the authors of the biographies of Chinese leaders. The information used to build this database are from China Vitae (www.chinavitae.com) and official Chinese news sources.

- Variable “Age of Governor” is the age of the #2 official in the provincial-level hierarchy. The data are principally from China Vitae (www.chinavitae.com) with missing values found from official Chinese news sources.
- Variable “Age of Party Secretary” is the age of the #1 official in the provincial-level hierarchy. The data are principally from China Vitae (www.chinavitae.com) with missing values found from official Chinese news sources.
- Variable “Turnover” is a dummy variable taking the value of 1 in all years when there is a change in at least one of the Governor or Party Secretary posts, and 0 in years with continuity in both of the top two posts in a province. The data are constructed from China Vitae with missing values found in official Chinese news sources.
- Variable “Retirement” is a dummy variable taking the value of 1 in all turnover years when the official leaving his top post is 65 or older. In all non-turnover years and years with turnover but when the officials leaving their posts are under the age of 65, retirement takes the value of 0. It has become a strong norm for officials to not be reappointed to high level positions after they turn 65 since the early 1980s. The data are constructed from the China Vitae-based biographical dataset.

* $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$

Table A3: Full results for random effects model with political control variables.

Robustness: Main Models with CDM Service Center Control

Table A4 shows the results from adding a dummy variable that scores “1” for provinces that established CDM service centers and is coded “0” otherwise. The data is taken from China’s Department of Climate Change, available from <http://cdm.ccchina.gov.cn/Web/ReferList.asp?ScrollAction=1>. This service center dummy turns out to be positive and highly statistically significant for the full sample and renewable CDM projects, while all our main results hold.
